Thumb Cellular, LLC's demonstration of complying with applicable service quality standards and consumer protection rules for voice services:

In establishing this certification in its *2005 ETC Order*,¹ the FCC found that an ETC must make “a specific commitment to objective measures to protect consumers.”² The FCC found that for wireless ETCs, compliance with CTIA’s Consumer Code for Wireless Service would satisfy this requirement and that the sufficiency of other commitments would be considered on a case-by-case basis.³ In this context, the FCC stated, “to the extent a wireline or wireless ETC applicant is subject to consumer protection obligations under state law, compliance with such laws may meet our requirement.”⁴

As a cellular provider, the Company is concerned about customer privacy and safety issues. The Company certifies that it has and will continue to comply with all applicable consumer protection laws and rules and all applicable service quality laws and rules. This document details the processes and procedures that the Company follows to ensure compliance.

The Company provides 2-way commercial mobile radio services (CMRS), or wireless service, to customers in Michigan’s “Thumb” area (in the eastern part of the Lower Peninsula in Huron, Tuscola, and Sanilac Counties). Thumb Cellular, LLC's demonstration of ability to function in emergency situations for voice services:

Thumb Cellular, LLC ("Company") hereby certifies that it is able to function in emergency situations as set forth in the Code of Federal Regulations, Title 47, Part 54, Subpart C, §54.202(a)(2)¹ and the Michigan Telecommunications Act (MTA). The Company's network is designed to remain functional in emergency situations without an external power source, is able to reroute traffic around damaged facilities, and is capable of managing traffic spikes resulting from emergency situations as required by Section 54.202(a)(2). The Company can change call routing translations as needed to reroute traffic around damaged facilities. Changing call routing translations will also allow the Company to manage traffic spikes throughout its network, as emergency situations require.

Specifically, the central office building is supplied with standby generators and battery back-up that enable the central office to keep running until power is restored so long as fuel is available, or until system changes are made to reroute traffic. The Company has battery backup at all office locations and in its electronic equipment sites in accordance with the specifications identified in Section 305c(a) of the MTA, 484.2305c.

The Company has a central office in Pigeon, Michigan. Its central office is equipped with permanent battery back-up power – with battery packs bolted to the floor. That central office's battery packs provide up to about 12 hours of battery back-up functionality. It also has a standby generator in place in its central office. The company also has a large portable generator that can also be used to provide functionality. Those generators, coupled with the permanent battery back-up, enable the Company's central office to keep running for up to about at least 12 hours on pure battery-

¹ Section 54.202(a)(2) requires ETCs that are designated by the Commission to "demonstrate its ability to remain functional in emergency situations, including a demonstration that it has a reasonable amount of back-up power to ensure functionality without an external power source, is able to reroute traffic around damaged facilities, and is capable of managing traffic spikes resulting from emergency situations."

back-up power, and indefinitely until either power is restored on generator power (so long as fuel is available for the generators) or system changes are made to re-route traffic.

Therefore, as to the requirement in 47 CFR 54.202(a)(2), it has at least 12 hours of back-up battery power that allow it to function in an emergency situation without an external power source. The Company's permanent and portable generators at its central office also allow it to provide power if there is no external power source for an unlimited amount of time (as long as fuel was available).

In addition, the Company has implemented industry practices to re-route traffic around damaged facilities and to manage traffic spikes resulting from emergency situations. It can re-route traffic around damaged facilities by electrical redundancy for all routes that come to the Company's central office. Electrical redundancy means that if the Company had problems with one fiber, it could shift the traffic from that one fiber to another fiber in the same sheath since a fiber sheath has several fiber strands within it.

Further, it can manage traffic spikes resulting from an emergency situation by having back-up power ready and available and having toll electrical redundancy, meaning that all of the Company's facilities are able to keep traffic moving and connecting to manage any traffic spikes that may arise from emergency situations. The Company can also change call routing translations as needed to re-route traffic around damaged facilities. Changing call routing translations also allows the Company to manage traffic spikes throughout its network, as emergency situations require.

As the above demonstrates, the Company can re-route originating traffic to alternate transport carriers with interconnecting facilities are out of service. This allows all of the Company's facilities to keep traffic moving and connecting to manage any traffic spikes that may arise from emergency situations. The Company can also change call routing translations as needed to re-route traffic around damaged facilities. Changing call routing translations also allows the Company to manage traffic spikes throughout its network, as emergency situations require. Its network is engineered to provide

maximum capacity to handle excess traffic in the event of traffic spikes resulting from emergency situations.

The Company also meets the requirements in MCL 484.2305c. As explained above, it has equipped its central office, remote switch, and remote line unit, and interexchange toll switching office or access tandem far above the minimum hours of peak load battery reserve. It also has a permanent generator at its central office, along with a portable generator that may be used to connect its central offices, remote switches, and remote line units within 8 hours.²

² The Company has reasonable amounts of back-up power to provide functionality without an external power source in the form of battery back-up power at each cell site, which enables it to provide service for a minimum of 4-6 hours. It has back-up portable power generators that can be deployed in emergency situations.
